## Abstract

The purpose of this study was to investigate the effect of combined  $\text{Ca}^{2+}$  cross-linking and freeze-thawing cycle method on metronidazole (model drug) drug release and prepare a wound film dressing with improved swelling property. The hydrogel films were prepared with sodium alginate (SA) using the freeze-thawing method alone or in combination with ionotropic gelation with  $\text{CaCl}_2$ . The gel properties such as morphology, swelling, film thickness, and content uniformity and *in vitro* dissolution profiles using Franz diffusion cell were investigated. The cross-linking process was confirmed by differential scanning calorimetry (DSC) and Fourier transform infrared (FTIR) spectroscopy. *In vitro* protein adsorption test, *in vivo* wound-healing test, and histopathology were also performed. The hydrogel (F2) composed of 6% sodium alginate and 1% metronidazole prepared by combined  $\text{Ca}^{2+}$  cross-linking and freeze-thawing cycles showed good swelling. This will help to provide moist environment at the wound site. With the *in vivo* wound-healing and histological studies, F2 was found to improve the wound-healing effect compared with the hydrogel without the drug, and the conventional product.

## KEY WORDS

alginate Ca<sup>2+</sup> cross-linking freeze-thawing swelling wound dressing
