Synthesis and assessment of anti-inflammatory activity of a chlorosubstituted chalcone derivatives and using the semi-empirical methods to measure the linked physicochemical parameters .

Abstract

The present research was planned to synthesize chlorinated by condensing acetophenone chalcone derivatives with chlorinated benzaldehyde in presence of sodium hydroxide. The activity was evaluated practically by anti-inflammatory measuring cotton bellets induced granuloma. Theoretical evaluation was made by using HyperChem software. Chlorinated derivatives (CHD) showed chalcone comparable antiinflammatory effect to diclofenac sodium, and less than dexamethsone.
