## Highlights

- A new series of novel ferrocene derivatives containing selenazole-moiety were synthesized.
- Ferrocenyl selenocarboxamide and 3,5-diferrocenyl-1,2,4-selenadiazole were synthesized.
- The new compounds showed potential biological activity against *Staphylococcus* aureus, Escherichia coli and Pseudomonas aeruginosa strains.

#### **Abstract**

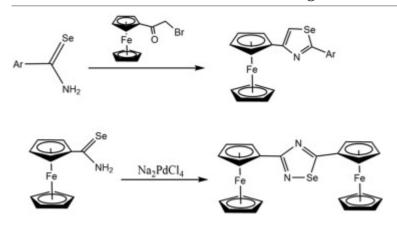

New ferrocenyl containing selenazole derivatives were synthesized from reactions of aryl selenocarboxamide (i.e. Ar-C=Se(NH<sub>2</sub>); Ar= $C_6H_5$  (1), 4-Br- $C_6H_4$  (2), 4-Ph $C_6H_4$  (3), 4-CH<sub>3</sub>OC<sub>6</sub>H<sub>4</sub> (**4**), 4-CH<sub>3</sub>SC<sub>6</sub>H<sub>4</sub> (**5**), 6-MeO–naphyl (**6**), 4-MeO–naphthyl (**7**), 4-C<sub>2</sub>H<sub>5</sub>OC<sub>6</sub>H<sub>4</sub> (**8**),  $3,4-(CH_3O)_2C_6H_3$  (9), and  $3,5-(CH_3O)_2C_6H_3$  (10)) with (2-bromoacetyl) ferrocene. The structures of the new compounds were determined by elemental analyses, IR,  $^1$ H and  $^{13}$ C NMR and mass spectroscopic data.

Reaction of 1-cyanoferrocene with sodium hydrogen selenide (NaHSe) in methanol gave the new ferrocenyl selenocarboxamide ( $\mathbf{11}$ ) in 27% yield. Treatment of compound  $\mathbf{11}$  with a catalytic amount of Na<sub>2</sub>[PdCl<sub>4</sub>] gave 3,5-diferrocenyl-1,2,4-selenadiazole in 35% yield. Both compounds were characterized elemental analyses and spectroscopic techniques.

Compounds **1–10** and **12** were screened as antibacterial agents against *Staphylococcus aureus*, *Escherichia coli* and *Pseudomonas aeruginosa* and showed promising properties.

### Graphical abstract

New ferrocenyl containing selenazole derivatives, ferrocenyl selenocarboxamide and 3,5-diferrocenyl-1,2,4-selenadiazole were prepared and characterized by several spectroscopic techniques. The new compounds were screened as antibacterial agents against *Staphylococcus aureus*, *Escherichia coli* and *Pseudomonas aeruginosa* and showed promising properties.
